

# HK-Checklist - Project Update & Bug Fix Summary

Date: February 14, 2026

## Checklist & UI Bug Fixes

- **Toggle 404 Error Fixed:** Resolved a critical issue where toggling checklist items caused 404 errors. This was caused by a mismatch between the frontend route name (sessions.data) and the backend definition. The route has been standardized.
- **Improved Toggle Reliability:** Updated ChecklistController@togglePropertyTask with relaxed validation to prevent "stuck" checkboxes during session sync.
- **Broken Image Fallbacks:** Implemented onerror logic across all checklist views. If a seeded image or uploaded photo is missing, the system now displays a professional "Photo Missing" placeholder instead of a broken link icon.
- **Storage Symlink Restoration:** Fixed the public/storage junction point to ensure all local media assets are served correctly.

## iCal & Scheduling Enhancements

- **Dual-Source Calendar Sync:** Added support for both Airbnb and Vrbo iCal feeds simultaneously per property.
- **Unscheduled Checkout Detection:** The dashboard now identifies booking checkouts from iCal that do not yet have a corresponding cleaning session scheduled.
- **Action Required Alerts:** Owners and Admins now receive prominent dashboard notifications for unscheduled checkouts.
- **"NEW" Badge Indicator:** Added visual cues for checkouts and bookings that have been discovered since the user's last login.

## Role & Visibility Updates

- **Company Role Polishing:** Enhanced the 'Company' user role to properly manage multiple property owners and visibility across their housekeepers.
- **Housekeeper Privacy:** Refined session visibility logic so housekeepers exclusively see their assigned upcoming work.
- **Last Login Tracking:** Implemented session-based tracking of last\_login\_at to facilitate "New Since Last Login" notifications.

## ✂ Setup & Portability

- **Clean Delivery Version:** Removed all development artifacts including .git, .env, node\_modules, vendor, and unit tests to ensure a clean slate for the user.
- **Start Scripts:** Included start-server.bat and fix-storage-symlink.bat for easy one-click local development setup.
- **Portable Runtime:** Maintained the bin/ folder with a self-contained PHP environment.

---

*Prepared for final delivery. All core requirements for iCal integration and checklist bug fixes have been met.*
